## NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 5\_COD\_Question 4

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

John, a computer science student, is learning about binary search trees (BST) and their properties. He decides to write a program to create a BST, display it in post-order traversal, and find the minimum value present in the tree.

Help him by implementing the program.

### **Input Format**

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

#### **Output Format**

The first line of output prints the space-separated elements of the BST in postorder traversal.

The second line prints the minimum value found in the BST.

Refer to the sample output for formatting specifications.

```
Sample Test Case
```

```
Input: 3
    5 10 15
   Output: 15 10 5
    The minimum value in the BST is: 5
    Answer
    #include <stdio.h>
    #include <stdlib.h>
    struct Node {
      int data:
      struct Node* left;
      struct Node* right;
   struct Node* createNode(int data) {
      struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
      newNode->data = data;
      newNode->left = newNode->right = NULL;
      return newNode;
    }
    struct Node* insert(struct Node* root, int data) {
      if (root == NULL) {
        return createNode(data);
      if (data < root->data) {
      root->left = insert(root->left, data);
else {
        root->right = insert(root->right, data);
```

```
24,180,10,10
                                                       241801076
return root;
    void displayTreePostOrder(struct Node* root) {
       if (root == NULL) return;
       displayTreePostOrder(root->left);
       displayTreePostOrder(root->right);
       printf("%d ", root->data);
    }
                                                                                  241801016
     int findMinValue(struct Node* root) {
       if (root == NULL) {
         printf("Tree is empty!\n");
         return -1;
       while (root->left != NULL) {
         root = root->left;
       }
       return root->data;
    }
    void freeTree(struct Node* root) {
       if (root == NULL) return;
       freeTree(root->left);
     freeTree(root->right);
       free(root);
     int main() {
       struct Node* root = NULL;
       int n. data:
       scanf("%d", &n);
       for (int i = 0; i < n; i++) {
         scanf("%d", &data);
                                                                                  241801076
                                                       241801016
         root = insert(root, data);
       displayTreePostOrder(root);
```

```
241801016
        printf("\n");
        int minValue = findMinValue(root);
printf("The minimum value in the BST is: %d", minValue);
        return 0;
      }
      Status: Correct
                                                                                  Marks: 10/10
